User Activated Key Views				
	User choses to watch a video	User wants to preview what they might watch next	User wants to see what other options are available	User deep dives into an option to play a new video or save for later

While Video is Playing: Default Player Overview

While any video is playing, the user has the ability to browse other content and control their overall watching experience through the following four states within the video player.

1. Watch
2. Binge
3. Browse
4. Deep-Dive

These states of the video player are all user activated, and are defined by their own specific content and functionality.

Each state satisfies a group of core user needs for watching and browsing during a video.
